

R.O.B. Vision quick reference

R.O.B. is virtual. A local controller and optional camera path are available for trials; UNO Q capture timing and Gyromite game feedback are not yet verified. The browser preview is also available.

Preview controls

Control	Result
Gyromite / Stack-Up / Pose Lab	Choose a game accessory scene or R.O.B.'s motion sandbox.
Run Demo Sequence	Start a finite animation. Gyromite ends with both gyros stored; Stack-Up moves red alone, then blue and white together.
Stack-Up Commands	Apply one local virtual turn, height change, open, or close; valid actions update the disc stacks.
Pose Preview	Try R.O.B.'s movement locally in Gyromite or Pose Lab.
Home	Reset all virtual pieces, buttons, pose, and timers.
Emergency Stop / Reset Stop	Cancel or re-enable the local simulation.

Planned connected loop

```
cabinet game flash -> UNO Q camera -> validated command -> virtual R.O.B. + pieces
                                     v
                               browser on laptop / iPad / phone
Gyromite virtual pad state -> Wi-Fi/Ethernet -> game-host Controller 2 receiver
```

An unspun gyro held on one pad can press one gate. A spinning gyro remains on a pad while R.O.B. operates the other. When no longer needed, gyros return to holders. The preview's 55-second spin timer is illustrative. A lost game link releases both virtual buttons.

SIMULATION / GAME LINK OFFLINE means no game is connected. **NO SIGNAL** or **UNREADABLE SIGNAL** will mean no virtual action in the planned camera mode. See the [user guide](#) and [virtual system contract](#).
